The Problem

//

DeFi lending protocols today use static parameters. Fixed interest rates. Fixed collateral ratios. When the market crashes, these protocols can't adapt — leading to cascading liquidations and billions in losses. Aave lost \$1.6 million in bad debt in a single event. The problem is clear: DeFi needs intelligence.

STATIC

Fixed curves don't react to market

SLOW

DAO votes take days/weeks

BLIND

No real-time adaptation

0:20 — 0:40

The Solution

//

SolanaAI Lend is an autonomous AI-powered lending protocol on Solana. Every 2 minutes, our AI agent analyzes the market using 5 technical indicators, 6 machine learning models, news sentiment analysis, and Google Gemini — then writes optimized parameters directly to the blockchain. Interest rates, collateral ratios, and borrow limits adjust in real time to market conditions. Not in hours. Not with governance votes. In minutes.

How It Works

//

The pipeline: CoinGecko price data flows into RSI, MACD, and Bollinger Bands. Six ML models — RandomForest for trend, IsolationForest for anomalies, EWMA for volatility, a crash detector, risk scorer, and utilization predictor — generate signals. Gemini synthesizes everything into a decision. A validator checks 11 safety rules. The smart contract enforces hard limits on-chain. Seven layers of safety — from prompt to contract to insurance fund. If the AI tries anything outside bounds, the transaction is rejected.

What Makes Us Different

"Four things set us apart:"

1

Self-Improving AI

We track each model's prediction accuracy over time and dynamically reweight them. The AI gets smarter every cycle.

2

Crash Detection

Six signals predict market crashes before they happen. Above 80% crash probability, the protocol freezes automatically. No human intervention needed.

3

On-Chain Credit Scores

Five factors give every wallet a reputation tier — Platinum users earn lower collateral requirements and better rates. DeFi with personalized risk.

4

Real Safety, Not Theater

Smart contract has guardrails in a separate PDA, insurance fund from 10% of all interest, auto-rate fallback if the AI dies, and emergency freeze. The protocol never stops, and it never trusts the AI blindly.

1:35 — 1:50

Traction & Technical Depth

//

This is live on Solana devnet right now. 23 smart contract instructions in Rust with Anchor. A full React dashboard with real-time WebSocket updates. Five Docker containers. The AI agent has made hundreds of on-chain decisions — every single one verifiable on Solana Explorer. This is not a mockup — it's a working protocol.

Closing

//

Current DeFi is static. Markets are dynamic. SolanaAI Lend bridges that gap — AI that adapts in real time, controlled by a smart contract that never compromises on safety. AI thinks. The contract controls. Verify on-chain.

//

Live at 89.207.255.254. Open source on GitHub. Thank you.

AI thinks. The contract controls.

Verify on-chain.
